## QSAR TOOLBOX

The OECD QSAR Toolbox for Grouping Chemicals into Categories

## OECD QSAR Toolbox v.4.4.1

Step-by-step example of how to evaluate an ad-hoc category of aliphatic amines and to predict an ecotoxicological endpoint

- Background
- Keywords
- Category evaluation overview

## Background

- This is a step-by-step presentation designed to take you through the workflow of the Toolbox for evaluating an ad-hoc category.
- You will learn several new functionalities which will be repeated to assure a consistent category is defined.
- It is assumed that you now have some experience in using the Toolbox so there will be multiple key strokes between screen shots.

- Background
- Keywords
- Category evaluation overview

## **Keywords**

**TARGET CHEMICAL -** chemical of interest

**MODULE** – a Toolbox module is a section dedicated to specific actions and options (e.g. Profiling)

**WORKFLOW** – the use, in combination, of the different modules (e.g. prediction workflow: from input to report)

**PROFILER** - algorithm (rule set) for the identification of specific features of the chemicals. Several types of profilers are available, such as structural (e.g. Organic functional groups), mechanistic (e.g. Protein binding by OECD) and endpoint-specific (e.g. in vitro in vitro mutagenicity (Ames test) alerts by ISS) profilers.

**ALERT** - the profilers consist of sets of rules or alerts. Each of the rules consists of a set of queries. The queries could be related to the chemical structure, physicochemical properties, experimental data, comparison with the target or list with substances and external queries from other predefined profilers (reference queries).

**CATEGORY** – "group" of substances sharing same characteristics (e.g. the same functional groups or mode of action). In a typical Toolbox workflow, it consists of the target chemical and its analogues gathered according to the selected profilers

**ENDPOINT TREE** – Endpoints are structured in a branched scheme, from a broader level (Phys-Chem properties, Environmental Fate and transport, Ecotoxicology, Human health hazard) to a more detailed one (e.g. EC3 in LLNA test under Human health hazard-Skin sensitization)

**DATA MATRIX** – Table reporting the chemical(s) and data (experimental results, profilers outcomes, predictions). Each chemical is in a different column and each data in a different row

## **Category Evaluation** Two phases of evaluation process

#### **<u>Phase I.</u>** Evaluation of Category & Data Gap Filling:

- Investigating the structural consistency of an ad hoc category (e.g., a category submitted by an industry consortium to a regulatory assessment program).
- Implementation of ad hoc category building and data gap filling.

#### *Phase II.* Extension of Category & Data Gap Filling:

- Search for other analogues which are consistent with the submitted category.
- Data gap filling using new data matrix.

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
      - Case study

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category Case Study

- The submission consists of a category with 19 aliphatic amines.
- The predicted ecotoxicological endpoint EC50, 48h, D.magna of 2-Butanamine (CAS 13952-84-6) will be reviewed.

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
      - Case study
      - Workflow

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category *Workflow*

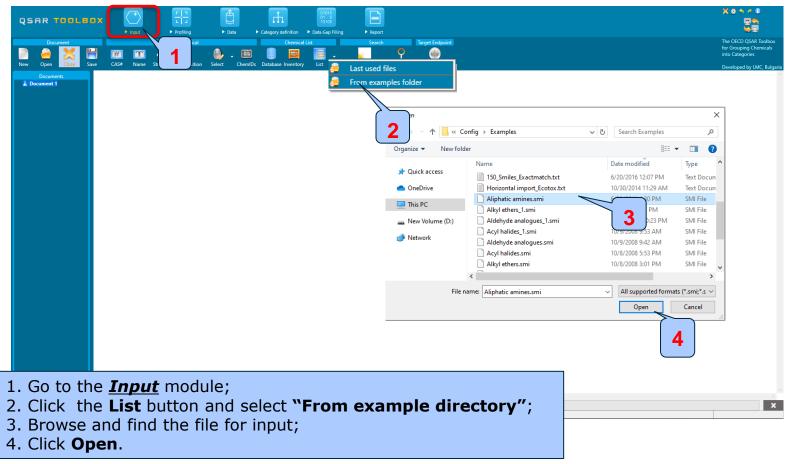

#### The following input workflow is used:

- Input the file for submission as an user list (In this case input file Aliphatic amines.smi\* from example directory).
- Evaluate the category applying the following profiling schemes:
  - US-EPA New Chemical Categories
  - Aquatic toxicity classification by ECOSAR
  - Aquatic toxicity MOA of action
  - Organic functional groups (nested)

Aliphatic amines.smi\* - file is available with TB installation, located at C:\Program Files (x86)\Common Files\QSAR Toolbox 4.4\Config\Examples

        - Input

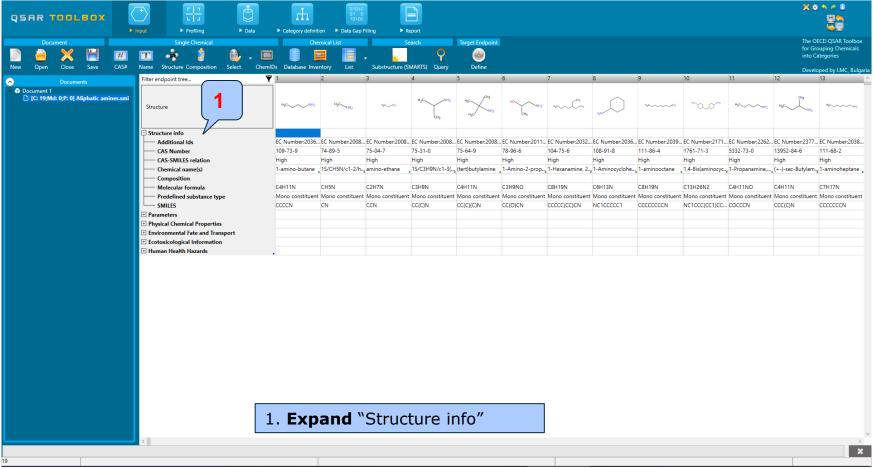

Step 1. Investigating the structural consistency of an ad hoc category *Workflow/Input* 

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category *Workflow/Input*

- You have now inserted your chemical list into the system.
- Click on the box next to "Structure info"; this displays the chemical identification information (see next screen shot).

Step 1. Investigating the structural consistency of an ad hoc category *Workflow/<u>Input</u>* 

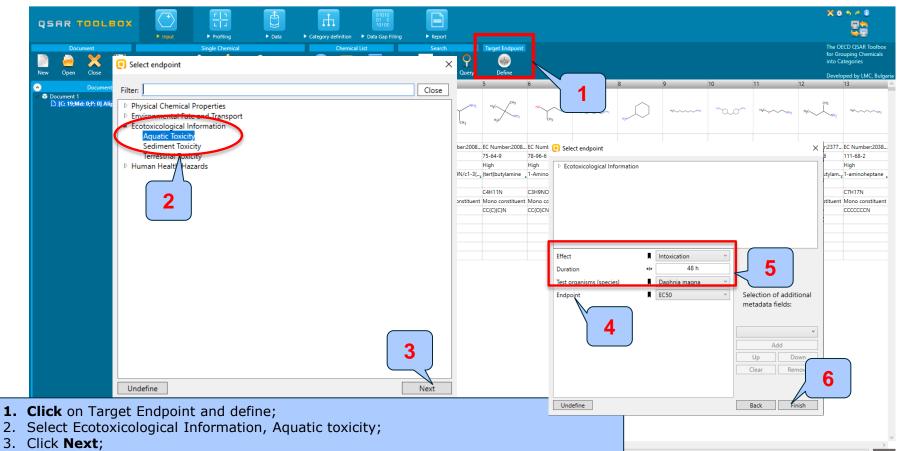

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
      - Case study
      - Workflow
        - Input
        - Define target endpoint

## **Input** Define target endpoint

- Defining of the endpoint allows entering the endpoint of interest e.g. EC3, LC50, gene mutation etc., along with specific metadata information. Based on the metadata, relevancy of the profiles and databases is provided expressed in different highlighting:
  - In green are highlighted the most suitable profilers related to the endpoint and databases including data for the defined target endpoint, while
  - In orange are colored profilers which are plausible with respect to the defined target endpoint.

## **Define target endpoint** Overview

- 4. Select endpoint **EC50** from the drop down menu; and consecutively select the following metadata
- 5. Test organism(spices) Daphnia magna; Duration 48 h; Effect Intoxication;
- 6. Click Finish.

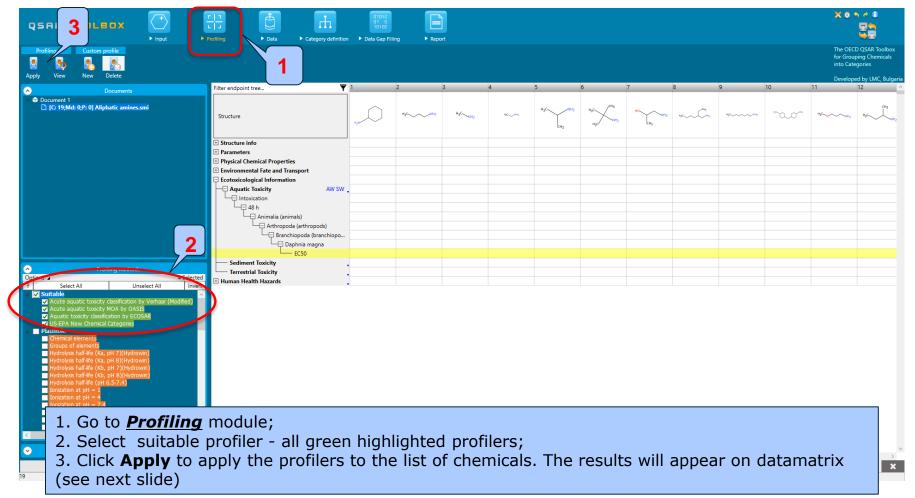

## **Define target endpoint** Overview

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category *Workflow/Profiling*

- The first step of the category evaluation according to Phase I is the consistency check of the category which starts with evaluation of the robustness with respect to structural functionalities. The following schemes could be used for this purpose:
  - US-EPA New Chemical Categories (hereafter cited as US-EPA)
  - Aquatic toxicity classification by ECOSAR (i.e. ECOSAR)
  - Aquatic toxicity MOA of action (i.e. MOA)
  - Organic functional groups (nested) (i.e. OFG(nested))
- Select "profiling methods" by clicking on the boxes before the names of the profilers and Click "Apply". Before selecting the profiling methods unselect all (see next screen shot).

Step 1. Investigating the structural consistency of an ad hoc category *Profiling*

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category *Workflow/Profiling*

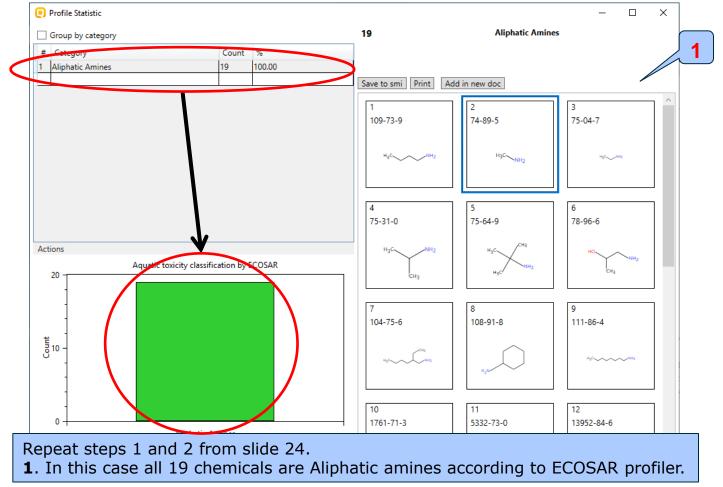

- The actual profiling will take several seconds depending on the number and type of selected profilers.
- The results of profiling automatically appeared as a dropdown box under the target chemical.
- The overall result for the list of chemicals can be seen by right clicking in the space near the profiler in the endpoint tree and select Profile statistics from the dropdown menu (see next screen shot).

Step 1. Investigating the structural consistency of an ad hoc category *Profiling* 

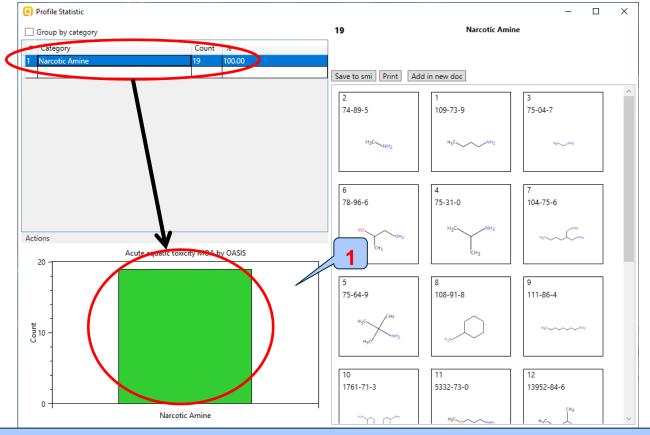

1. Right click above US-EPA profiler; 2. Select **Profile Statistics**; 3. A window appears with profile statistics for the list of chemicals across "US-EPA" profiler. All the chemicals are "Aliphatic amine"

#### Step 1. Investigating the structural consistency of an ad hoc category *Profiling/<u>Statistics according to ECOSAR</u>*

Step 1. Investigating the structural consistency of an ad hoc category

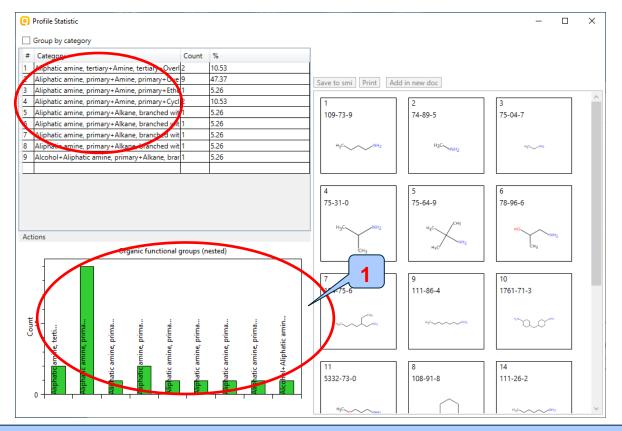

#### Profiling/<u>Statistics according to Aquatic toxicity MOA by</u> <u>OASIS</u>

#### 1. In this case all 19 chemicals are Narcotic amines according to MOA by OASIS profiling scheme

# Step 1. Investigating the structural consistency of an ad hoc category

Profiling/Statistics according to OFG (nested)

**1**.In this case all the chemicals in the category are categorized as "Aliphatic amine," according to OFG (nested) scheme

#### Phase I: Evaluation of Category & Data Gap Filling Step 1. Investigating the structural consistency of an ad hoc category *Recap*

#### • Chemicals are defined as:

- Aliphatic amines (broader category than primary amines)
   US-EPA categories, ECOSAR classification
- The statistics of organic functional groups provide detailed alert description of all 19 structures. However, all 19 chemicals have aliphatic amines fragment.
- It could be concluded that the category is consistent with respect to structural functionalities (chemicals are empirically similar- they all are aliphatic amines).

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
    - <u>Step 2</u>: Investigating the applicability domain of an ad hoc category.

#### **<u>Phase I:</u>** Evaluation of Category & Data Gap Filling Step 2. Investigating the applicability domain of an ad hoc category

# In step 2, the applicability domain of the category will be investigated. The domain consist of two layers:

- Boundaries of structural functionalities
  - Aliphatic amines
- Parametric boundaries
  - log Kow (from 0.64 to 7.71)
  - Molecular weight (from 31 to 269 Da)
  - Water solubility (from  $0.48 \times 10^{-1}$  to  $1 \times 10^{6}$  mg/l)

You are now ready to extract the 2D and/or 3D parameters in order to check the parametric boundaries (see next screen shot).

Step 2. Investigating the applicability domain of an ad hoc category *Extracting 2D and 3D parameters*

#### All calculated 2D parameters appears on data matrix.

Step 2. Investigating the applicability domain of an ad hoc category *Extracting 2D and 3D parameters - results* 

The boundaries of the three phys-chem parameters fall in the following ranges:

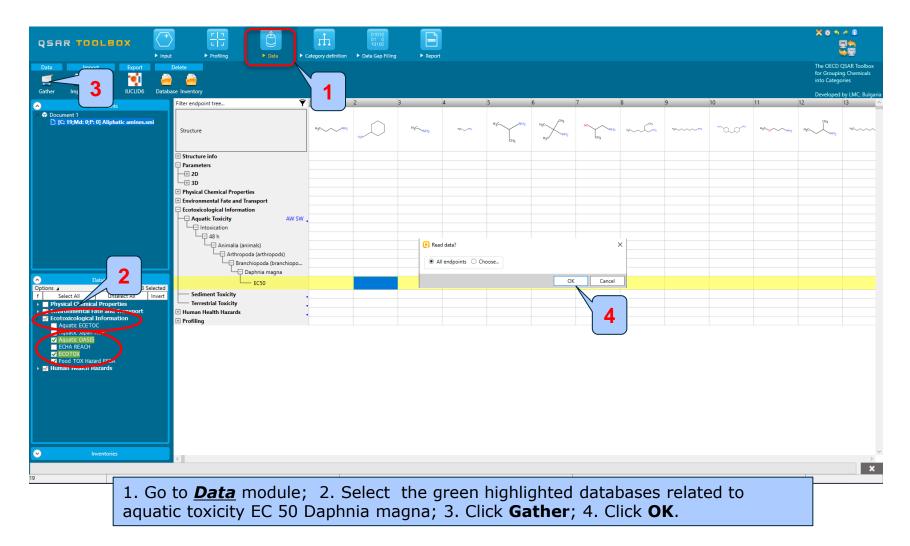

- 1. log Kow (from 0.64 to 7.71)
- 2. Molecular weight (from 31 to 269 Da)
- 3. Water solubility (from  $0.48 \times 10^{-1}$  to  $1 \times 10^{6}$  mg/l)

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
    - <u>Step 2</u>: Investigating the applicability domain of an ad hoc category.
    - <u>Step 3:</u> Reading data for the analogues

#### Phase I: Evaluation of Category & Data Gap Filling Step 3. Reading data

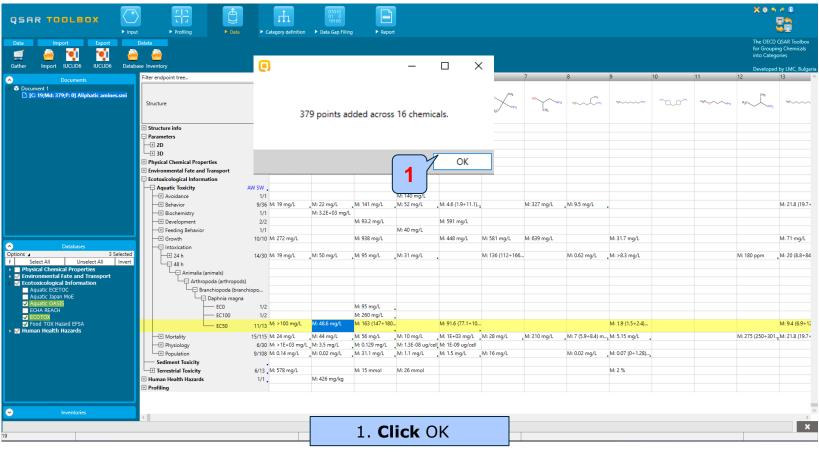

- Next, the Data matrix is constructed by extracting available experimental results for all 19 members of the category.
- Based on preceding category evaluation, no outliers have been identified violating the structural and mechanistic consistency of the category.

#### Phase I: Evaluation of Category & Data Gap Filling Step 3. Reading data

### Phase I: Evaluation of Category & Data Gap Filling Step 3. Reading data

The system automatically gives indication for the number of gather experimental data points

The OECD QSAR Toolbox for Grouping Chemicals into Categories

- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling
    - <u>Step 1:</u> Investigating the structural consistency of an ad hoc category.
    - <u>Step 2:</u> Investigating the applicability domain of an ad hoc category.
    - <u>Step 3:</u> Reading data for the analogues
    - <u>Step 4:</u> Data gap filling for 2-Butanamine

### Phase I: Evaluation of Category & Data Gap Filling Step 4. Data gap filling for 2-Butanamine

- As mentioned before (slide 28) the category is structurally and mechanistically similar
- Hence the data gap could be filled in for analogues from the category. In this case we will fill the gap for 2-Butanamine (this will be our target chemical)
- Before proceeding with filling data gap you should navigate to the column corresponding to the target chemical (see next slide).

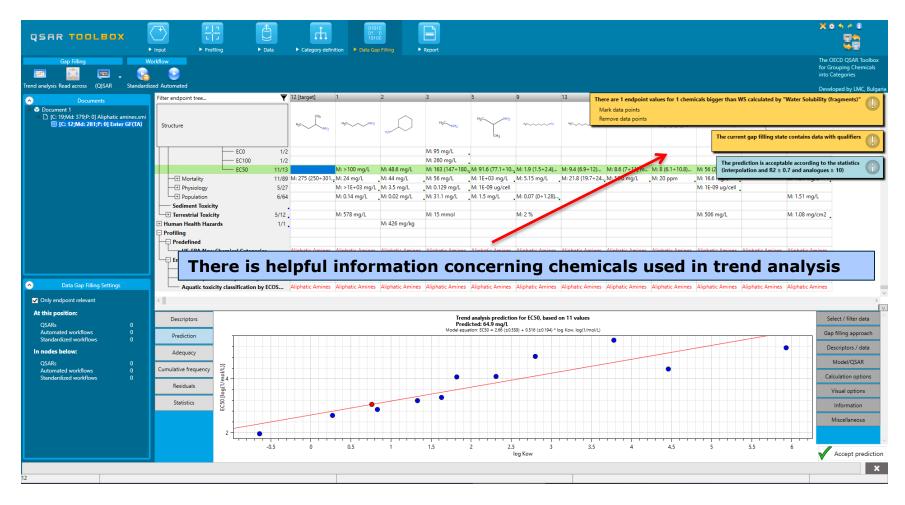

#### **Phase I: Evaluation of Category & Data Gap Filling**

Step 4. Data Gap Filling for 2-Butanamine *Navigate to the target chemical*

1. Go to <u>**Data Gap Filling**</u> module; 2. Found the target chemical (2-Butanamine); 3. Click on the cell corresponding to target endpoint (yellow highlighted row); 4. Click **Trend analysis**; Possible data inconsistency window appears, click **OK** (5)

### Phase I: Evaluation of Category & Data Gap Filling Step 4. Data Gap Filling for 2-Butanamine

### **Phase I: Evaluation of Category & Data Gap Filling**

Step 4. Data Gap Filling for 2-Butanamine/<u>Subcategorize by</u> <u>OFG(nested)</u>

There are many profilers to be used for subcategorization. The most suitable profilers (the green ones) does not found any dissimilar chemical. In this respect the structure-based OFG (nested) profiler is used for refining the category: 1. Open **Select/filter data, Subcategorization**; 2. Click on **OFG (nested)** then 3. Click **Remove selected** button

#### **1**. Coefficient of determination is higher - 0.974

#### Phase I: Evaluation of Category & Data Gap Filling Step 4. Data Gap Filling for 2-Butanamine/<u>Interpretation of the</u> <u>result</u>

- The structurally similar analogs across category of aliphatic amines is used for data gap filling
- Subcategorization by Organic functional groups(nested) is applied
- The prediction based on the defined category is acceptable.
- The predicted value based on predefined category of aliphatic amines is 79.0 mg/l

## **Outlook**

- Background
- Keywords
- Category evaluation overview
  - <u>Phase I.</u> Evaluation of Category & Data Gap Filling

### • <u>Phase II.</u> Extension of the Category& Data gap Filling

### Phase II: Extending the category & data gap filling

- The extension of the category is performed by using Phase II of the category evaluation process (*Extending the category & data gap filling*). Other analogues are searched in the Toolbox, which are structurally and mechanistically consistent with the predefined category.
- The structural analogues could be defined using ECOSAR grouping

	c	

1. The target chemical 2-Butanamine is loaded in new data matrix; 2. Moreover a new level appears in the documented tree. The latter allows easy go back and forward to different stages of the workflow.

- The ECOSAR strict category is used to define a broader category used in further analysis. The "Strict" option means that only the defined categories should be present in the found analogues and not any others.
- The same endpoint: EC 50 48h *D.magna* will be predicted as with the predefined category

- Define ECOSAR category
- Before defining the category, the following databases related to the target endpoint are selected (databases highlighted in green are those which have data for the target endpoint):

### Phase II: Extending the category & data gap filling Step 1: Category definition/Defining ECOSAR (strict)

	Profiling		Hore 10 000 Gap Filling	
Categorize	Category consistenc Category elements		Grouping options (Aquatic toxicity classification by ECOSAR) —      X     Target categories

1. A message appears informing that 370 analogs are found. Click **OK** 

#### Phase II: Extending the category & data gap filling Step 1: Category definition/<u>Reading data</u>

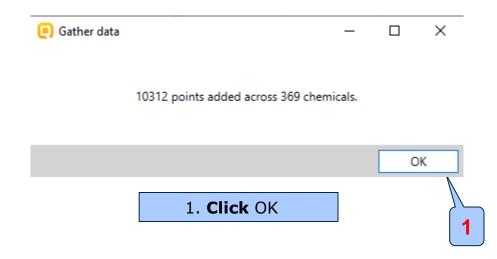

- The Toolbox will now retrieve those chemicals that have the same ECOSAR functionality as the target compound.
- The Toolbox automatically requests the user to select the endpoint that should be retrieved.
- The user can either select the specific endpoint or by default choose to retrieve data on all endpoints (see below).

💽 Read data?																																											>	<		
All endpoints O Choose																																														
																													[			С	)k	(		]		C	a	n	c	e			]	

 In this example, as only databases are selected that contain information for aquatic toxicity endpoint, both options give the same results.

#### Phase II: Extending the category & data gap filling Step 1: Category definition/<u>Reading data</u>

The system automatically gives an indication for the number of experimental data points gathered

## Outlook

# **Saving the prediction result**

- This functionality allow storing/restoring the current state of Toolbox documents including loaded chemicals, experimental data, profiles, predictions etc, on the same computer. The functionality is implemented based on saving the sequence of actions that led to the current state of the Toolbox document and later executing these actions in the same sequence in order to get the same result(s).
- Saving/Loading the file with TB prediction is shown on next screenshots

# Saving the prediction result

#### and **Save** the workflow.
