I. Introduction & Requirements for QSAR Toolbox installation

1. Introduction

This document provides a step by step description of the installation procedure of the QSAR Toolbox (version 4.6) set-up kit on a local PC operating Microsoft® Windows®.

The new QSAR Toolbox 4.x is not a continuation of the Toolbox 3.4 codebase. It is a new system, designed from the bottom up and rewritten using new underlying technologies and database management sub-system. This in turn means a completely different deployment experience. QSAR Toolbox 4.6 is a major update to Toolbox and can be installed alongside previous versions of 4.x.

Version 4.6 is migrated to .NET 6.0 (as opposed to Toolbox 4.5 using .NET 5.0). This means that it must be installed regardless of existing Toolbox.

PostgreSQL dependency has also been reworked. Now the user is provided with the optionality to not install or care for the existence of PostgreSQL. They can deploy the QSAR Toolbox Database in a portable mode, whereby they’d need only specify an empty, writable, folder on their local hard drive. For the advanced use-cases a database deployment on an existing PostgreSQL 13 install is still available.

2. Requirements

It is recommended to use an up-to-date PC with 64 bit operating system (required) and a processor running at 2.4GHz or faster, 17 Gigabyte of hard disc space for storage and 6 Gigabyte of RAM to operate. In order to run this installation you will need administrator rights on your local PC. However, once installed, normal user rights will be sufficient for running the application.

The following components will be installed on your PC if they are not already available:

- Microsoft .NET 6.0

II. QSAR Toolbox installation

Before starting to install the Toolbox, make sure that all files are extracted from the downloaded package. Navigate to the CD on which you have received the application or to the folder into which
you have downloaded the package. Right click over the package and select to extract the content to a new directory.

**Do not start to install Toolbox directly from the downloaded package.**

**Note:** The installation package was compressed using the WinZip software, version 17. Other applications might not be able do decompress the package as different applications may implement the ZIP format differently. A free alternative that was tested with the installer package is the 7-Zip application. 7-Zip can be downloaded from [http://www.7-zip.org/](http://www.7-zip.org/).

QSAR Toolbox v.4.6 is a major update to Toolbox and can be installed alongside previous versions of 4.x.

If you have not installed any of the previous versions of Toolbox v.4. (i.e. versions 4.0, 4.1, 4.2, 4.3 and/or 4.4, 4.5), you need to install the three basic components of QSAR Toolbox

1) .NET 6.0
2) Database
3) QSAR Toolbox application.

If you have previously installed PostgreSQL 13(optional) and .NET6.0, skip Step 1 and 2 and start directly from [Step 3. Database](#).

Double click on the “**StartInstall.exe**” file (Figure 1) (located in the directory where the extracted content from the package is) and follow the steps described below.

![Figure 1. Installation Startup screen](Image)
1. Step 1. PostgreSQL

**Note:** PostgreSQL installation is no longer required. This section is preserved for backward visibility and as pertaining to the advanced database deployment. The PostgreSQL installer is still distributed with the QSAR Toolbox installation package, however it is not displayed on the installation bootstrap window.

**Note:** Data folder should be on a drive that has at least **17 GB** of free space

**Step 1.1.** Start `postgresql-13.10-1-windows-x64.exe` (Figure 2)

![Figure 2. Start installation of PostgreSQL](image)

**Step 1.2.** You will be asked to select where the PostgreSQL should be installed and data stored. Leave the default setting. In the **Select components** stage you can uncheck the “Stack builder” component, as it is not needed for Toolbox (Figure 3).
Figure 3. Selection of folders where the PostgreSQL should be installed and data stored

**Note:** Make sure the Data folder is on a drive that has at least **17 GB** of free space.
**Step 1.3.** Next, you will be asked to enter the password and port (Figure 4).

Password: *postgres* (recommended)
Port: **5433** (by default)

![Password Setup](image1)
![Port Selection](image2)

**Important:** The same port must be defined during the deployment of Toolbox database (see 3.2) and installation of Toolbox (see 4.6)

**Figure 4.** Specifying password and port for the PostgreSQL

**Note:** Whatever you decide to put as a password and port, make sure you **write it down or memorize** it as it will be needed later in the installation procedure and generally throughout the PostgreSQL installation’s lifetime.
Step 1.4. You can simply click Next on Advanced Options and Pre Installation Summary, to click Finish (Figure 5)

Figure 5. Advanced Options and Pre Installation Summary

Now PostgreSQL is installed and you can continue with the installation of the Toolbox database.
2. Step 2. Microsoft .NET 6.0

Click on **Microsoft .NET 6.0 installer** and follow the onscreen instructions.

Figure 6. Install Microsoft .NET 6.0
3. Step 3. Database

Step 3.1. Select *QSAR Toolbox 4.6 Database* (Figure 7)

![Figure 7. Start installation of the QSAR Toolbox database]
Step 3.2. There are two modes for Database deployment.

3.2.1. Portable (simple) deployment

You will be asked to specify an empty, writable folder on the local hard drive.

Figure 8.1 Portable (simple) database deployment

Note: The database is never removed automatically. If you want to remove the database, you need to manually delete the folder (QSAR Toolbox Server would need to be shut down)

3.2.2. PostgreSQL Server (advanced) deployment

Note: A prerequisite for the database deployment step is that there is a functional PostgreSQL server listening. You could check that by going to Services tab of your Task manager (you can bring it up by holding Ctrl+Shift+Esc buttons). Look for a service with postgresql in its name (e.g. “postgresql”), it should have “Running” in the Status column.

You will be asked (Figure 8.2) to provide the PostgreSQL superuser password and listen port. (see 1.3):

- For password type the same password defined during PostgreSQL installation (see 1.3)
- For the port type **5433** (by default) and click the *Deploy* button. Be extra careful to enter the port you specified at step 1.3.

![Image of PostgreSQL Server (advanced) database deployment]

**Important:** The port must be the same as defined during the PostgreSQL installation (see 1.3)

**Figure 8.2. PostgreSQL Server (advanced) database deployment**

**Note:** If you have changed the password and you do not remember it, please follow the steps you will find at the following link in order to reset your PostgreSQL password:

[https://qsartoolbox.org/content/documents/ResettingPostgreSQLPassword.pdf](https://qsartoolbox.org/content/documents/ResettingPostgreSQLPassword.pdf)

**Note:** The database is never removed automatically. Since removing a database from an existing database cluster can be an involved process a “**Delete existing database**” button is provided that will remove the database from the server identified by the port and password.

**Step 3.3.** On the next confirmation message click on “Yes” (Figure 9). This warning message is related only to the same version of Toolbox. Deployment of the Toolbox v.4.6 database **will not** affect the previous databases.

![Image of Confirmation message for starting database deployment]

**Figure 9.** Confirmation message for starting database deployment
The full database deployment takes around 10-15 min depending on computer configuration and it should not be interrupted.

Continue with the last step of the Toolbox installation.
4. Step 4. QSAR Toolbox

Step 4.1. Select *QSAR Toolbox 4.6* (Figure 10)

![Figure 10. Start installation of the Toolbox application](image)

Figure 10. Start installation of the Toolbox application
Step 4.2. Start the installation of Toolbox by clicking Next (Figure 11)

Figure 11. InstallShield Wizard screen

Step 4.3. Accept the terms of the license agreement in order to continue with the Toolbox installation (Figure 12)

Figure 12. License agreement
Step 4.4. You will be asked for a destination folder of the Toolbox. Click Next to install the Toolbox to the default directory (Figure 13)

![Figure 13. Selection of Toolbox destination folder](image)

Step 4.5. Then you will be prompted to select the deployment mode for the installation suite. There are three deployment modes for available for QSAR Toolbox 4 - Standalone, Client only or Multi-user server.

- **Standalone** – This deployment mode should be used on a single computer. This deployment mode allows for creation of new profiling schemes, importing of databases and creation of new QSARs. This is the recommended deployment mode for users who will be developing profiling schemes, QSARs, databases.

- **QSAR Toolbox Desktop Client Only** - This mode will install only the Toolbox client. It will have to be connected to a separate deployment of a QSAR Toolbox multi-user Server.

- **QSAR Toolbox multi-user Server** - This deployment mode is similar to the standalone deployment, in that it installs both Server and Client layers of the QSAR Toolbox, however it configures the Server in multi-user mode. When connected to a multi-user server the user will have restrictions on certain features, such as creation of new profiles and importing of databases.

**Note:** In order to open a port for incoming connections the multi-user server needs to be started with administrative permissions (or equivalent).
Select the **Standalone** deployment mode used for a single computer and click **Next** (Figure 14).

![Figure 14. Selection of deployment mode of Toolbox](image)

**Step 4.6.** Next you will be prompted to enter the connection parameters for the Client and Server applications. This step will be skipped for the **Standalone** deployment mode, it will be displayed only for **QSAR Toolbox Desktop Client only** or **QSAR Toolbox multi-user Server** modes.

![Figure 15. Entering connection parameters](image)
Meaning of the parameters:

- **Client connect host**: This specifies the computer that the client will connect to.
- **Client connect port**: This is the port the client will use to connect to the Server. It should match the **listening port** that the Server was configured to listen to.
- **Server listening port**: This is the port the QSAR Toolbox Server will listen on (and Toolbox Client will try to contact on). **Server listening port** has a companion port, **SessionHealthMonitorPort**, which can be configured post installation, see the Note below.

**Step 4.7.** Finalize the Toolbox application install by click on “Install” and then “Finish” (Figure 16)

![Figure 16. Finalizing of the Toolbox Application installation](image)

Now all needed components for the proper work of Toolbox are installed and you can run the system.
III. How to transfer custom items from previous Toolbox versions into the new one?

1. Transfer custom items from QSAR Toolbox v.3.x to QSAR Toolbox v.4.6

   Two tools allowing to transfer custom items (profilers and databases) from QSAR Toolbox v. 3.x to QSAR Toolbox v.4.6 are available.

   a. **Transfer custom profilers**

      Package with a *Scheme Migrator App* (i.e. the tool allowing transfrerring of custom profiling schemes) could be downloaded from the following link:

      After extracting the content of the package, the *SchemeMigratorApp.exe* file should be manually placed in the COM34 folder created by the QSAR Toolbox 3.4 installation.

      The default path to the COM34 folder is:

      %PROGRAMFILES(X86)%/OASIS-LMC/COM34
Start the program by running the SchemeMigratorApp.exe file. Multiple Toolbox 3.x schemes can be loaded with the "Load schemes" button (1) (Figure 18). Sequential loading of schemes adds them to the list. The list of loaded schemes can be cleared by using the "Clear list" button (2). Once the scheme(s) have been loaded, they can be converted by clicking the "Convert!" button (3).

The conversion process may take from seconds to several minutes depending on the count, size and complexity of the input schemes, as well as on the computer hardware. Once the conversion process has been completed, a status log for each scheme is displayed in the Status pane informing whether the operation has succeeded.
In case of successful conversion, a new file (.plugin.config) will be created for each converted scheme. In order to be able to work with the converted schemes in QSAR Toolbox 4.6, they need to be placed in the CONFIG folder. Its default path is:

C:\Program Files\Common Files\QSAR Toolbox 4.6\Config\Addins\LMC.Toolbox.Server.Profiling

More details about the *Scheme Migrator App* could be found in the user manual included in the downloaded package.
2. Transfer custom items from QSAR Toolbox v.4.x to QSAR Toolbox v.4.6

a. Transfer custom profilers

Currently there is no tool allowing automatically transferring of profilers from of Toolbox v.4.x (i.e. Toolbox versions 4.0, 4.1, 4.2, 4.3, 4.4 and 4.5) to Toolbox v.4.6.

The users have to copy manually their custom profilers from the corresponding directory and to paste them into the profilers’ directory in the Toolbox v.4.6.

Default directory of the Toolbox v.4.3 profilers: \Program Files (x86)\Common Files\QSAR Toolbox 4.3\Config\Profilers

Default directory of the Toolbox v.4.6 profilers: \Program Files\Common Files\QSAR Toolbox 4.6\Config\Addins\LMC.Toolbox.Server.Profiling
IV. How to remove the previous Toolbox version(s)?

1. Removing of QSAR Toolbox v.3.x
   Uninstall the available 3.x versions of Toolbox directly from the Control panel of your computer:

   \textit{Control Panel\All Control Panel Items\Programs and Features}

   After the uninstallation of QSAR Toolbox, the database \textbf{will not} be removed. It should be deleted by hand.

2. Removing of QSAR Toolbox v.4.x
   The complete removal of QSAR Toolbox v.4.x happens in two steps: 1) uninstallation of the program and 2) deletion of the database.
   
   a. Uninstallation of QSAR Toolbox
      Uninstall the available 4.x versions of Toolbox directly from the Control panel of your computer:

      \textit{Control Panel\All Control Panel Items\Programs and Features}

      Uninstallation of QSAR Toolbox removes only the Toolbox application. The database should be further removed.

   b. Removing of the Toolbox database
      Preserving of the old Toolbox databases consume a lot of memory. In order to free some space on your computer, you could delete the old TB v.4.x databases (i.e. the databases of Toolbox v.4.0, v.4.1, v.4.2 and/or v.4.3) by using of the \textit{Database removal tool}. The tool could be downloaded from the link below:

      \url{https://qsartoolbox.org/downloads/tools/ToolboxDatabaseManagement.zip}

      Once the tool is downloaded, extract the content of the package and double click the \textit{ToolboxDatabaseManagement} executable (Figure 22).
Enter the port and the password of the PostgreSQL (1) and click Connect (Figure 23) (see step 1.3).

![ToolboxDatabaseManagement executable](image1)

Figure 22. ToolboxDatabaseManagement executable

Enter the port and password of the PostgreSQL

The settings are: port: **5432** (by default); password: **postgres** (as recommended)

![Toolbox Database Management](image2)

Figure 23. Enter the port and password of the PostgreSQL

Note: If you have changed the password and you do not remember it, please follow the steps you will find at the following link in order to reset your PostgreSQL password: [https://qsartoolbox.org/content/documents/ResettingPostgreSQLPassword.pdf](https://qsartoolbox.org/content/documents/ResettingPostgreSQLPassword.pdf)

All available databases from Toolbox v.4.x will appear. Select the old database(s) you want to delete (1) and click Delete selected databases (2) (Figure 24).

![Selected old database(s) to be deleted](image3)

Figure 24. Selection of old database(s) to be deleted
V. OASIS Metapath

Click on the OASIS Metapath item of the bootstrap application and follow the onscreen instructions.

VI. Known issues

➢ Running the QSAR Toolbox on limited user accounts

The QSAR Toolbox server requires administrative permissions to run when running in Remote connect mode. They are necessary in order for the application to open a port and listen for client connection.

➢ Toolbox Client starts, displays splash screen, but the application window disappears after that, leaving a process in the Task Manager.

For a workaround of this issue please visit the Known Issues section of the QSAR Toolbox website at https://qsartoolbox.org/download/issues/
